ABSTRACT
Background: Tourism accommodation operators in Krui suffer from fragile overland fresh supply chains, erratic delivery schedules, and verbal agreements lacking enforceability. Objectives: To reconstruct contractual certainty under Articles 1320 and 1338 of the Indonesian Civil Code while optimizing multi-stop fresh produce distribution. Methods: Comprehensive field study across 40 hospitality operators in Tanjung Setia, Mandiri Beach, and Krui City with route optimization modeling. Results: Formalizing Service Level Agreements with stipulated liquidated damages (Article 1243) reduces supply disruption frequency by 54% and cuts aggregate logistical overhead by 22.8%. Conclusion: Demonstrates that legal enforceability is an indispensable prerequisite for supply chain resilience in emerging remote tourism clusters.

Keywords: Pesisir Barat, Krui, Frontier Economics, Legal Certainty, Indonesian Civil Code, Empirical Modeling, Cold Storage.

Manuscript History: Received: 18 Sep 2026 | Revised: 10 Oct 2026 | Accepted: 22 Oct 2026 | Published Online: 02 Nov 2026

1. Introduction

West Coast Regency (Kabupaten Pesisir Barat), which was split off from West Lampung Regency (Kabupaten Lampung Barat) pursuant to Law No. 22 of 2012, constitutes one of the most peripheral territories on the western coast of Sumatra Island, bordering directly on the Indian Ocean. Geographically and administratively, this area is classified as a Backward, Frontier, and Remote (3T) region, as identified in the National Medium-Term Development Plan (Rencana Pembangunan Jangka Menengah Nasional, RPJMN) and the Presidential Regulation on the Acceleration of Development in Backward Areas (Bappenas, 2023).

Ironically, despite severe limitations in land-based infrastructure connectivity, the coastal zone of Krui—particularly Tanjung Setia Beach and Mandiri Beach—has experienced a surge in world-class marine tourism popularity. The presence of internationally-rated surf breaks has placed Krui on the official calendar of the World Surf League (WSL) Krui Pro competition, attracting thousands of athletes, officials, and foreign tourists from Australia, Europe, and the United States each year (WSL, 2024; Badan Pusat Statistik Pesisir Barat, 2023).

The influx of foreign visitors directly reshapes consumption patterns and the standard of requirements for the local hospitality industry. Accommodation operators—ranging from exclusive villas and surf-resorts to family-run homestays—are compelled to procure food-and-beverage inputs that meet international standards, including imported beef cuts, pasteurised milk, processed cheese, butter, cereals, as well as fresh non-tropical fruits and vegetables. This creates a sharp operational contradiction (das Sollen versus das Sein): on the one hand, the satisfaction standards of international guests demand timely delivery of high-quality, fresh foodstuffs; on the other hand, Krui lacks any large-scale horticultural or commercial livestock production centres, meaning that nearly 90 % of non-fish food commodities must be sourced from outside the regency, primarily from Bandar Lampung (approximately 240 km away) or from Jakarta via the Sunda Strait crossing.

In the tourism supply-chain literature, Zhang et al. (2020) emphasize that the efficiency of food provisioning in the hospitality sector is highly dependent on the stability of primary distribution networks and the capability of cold-chain logistics. Earlier research by Widodo et al. (2021) on the connectivity of remote islands in the Anambas Archipelago demonstrated …

2. Methodology

The authors note that load-imbalance in cargo volume and the absence of low-temperature storage facilities trigger a surge in logistics costs of up to double the baseline. In contrast, Thahir **et al.** (2021), in their study of Togean Islands National Park, found that the vulnerability of tourism in isolated regions stems from the fragmentation of local supply chains that are not professionally integrated. Nevertheless, both of these studies focus exclusively on the physical-operational dimension of logistics and do not relate their findings to the legal certainty of commercial contracts that bind micro-enterprise operators.

In the realm of civil business law, Gunawan & Siregar (2022) and Hartono & Wahyudi (2023) assert in their publications that micro-, small-, and medium-sized enterprises (MSMEs) operating in remote areas are highly vulnerable to civil losses due to the lack of written commercial supply agreements. According to Article 1338 of the Indonesian Civil Code (KUHPerdata), the principle of freedom of contract should provide the parties with the latitude to formulate protective clauses concerning rights and obligations in a balanced manner, including mitigation of breach (wanprestasi) and the regulation of force-majeure clauses for natural disasters (Subekti, 2020). Unfortunately, in the hospitality business practices of the 3T (tertinggal, terdepan, terluar) region of Krui, logistics transactions still rely on oral agreements (gentlemen's agreements or spot-market transactions), which place villa operators in an extremely weak bargaining position.

Research Novelty

A comprehensive review of the most recent scholarly literature reveals no prior study that holistically integrates:

1. Logistical barriers of the last-mile cold-chain within disaster-prone ecological conservation corridors (across the TNBBS network), and
2. Reconstruction of civil-law contractual certainty for hospitality-sector MSMEs in Indonesia's 3T areas.

The novelty of this article lies in the formulation of an integrated distribution model that combines physical logistics consolidation (micro-hub) with standardized Service-Level-Agreement (SLA)-based supply contracts. This model is derived from primary field-observation data and a preliminary feasibility study (DOI: 10.5281/zenodo.23979190; ResearchGate & Zenodo Preprint). The feasibility study is currently being conducted by the Research & Development Division of PT CHAIN ASIA CONNECT in West Coast Regency (Kabupaten Pesisir Barat).

3. Results and Discussion

3.1 Logistic "Last-Mile" Obstacles and Ecological Vulnerability Across the TNBBS

The field findings demonstrate that the geographic isolation of Krui constitutes the primary determinant that cripples the operational efficiency of tourism accommodations. The sole road link connecting the logistics hub of Bandar Lampung to Krui …

—

Methodology

3.2 Research Design

This study employs a juridical-empirical (socio-legal) approach combined with exploratory qualitative fieldwork (Soekanto & Mamudji, 2021). The juridical-empirical approach was selected to examine the functioning of contract law within the empirical reality of the hotel-industry business community in remote areas, with particular attention to the application of the principle of consensualism (Article 1320 of the Indonesian Civil Code, **KUHPerdata**) and the principle of good faith (Article 1338 paragraph 3 of the **KUHPerdata**) in hotel supply chains.

3.3 Type of Research & Subjects

Field research was carried out in the coastal region of Kabupaten Pesisir Barat, Lampung, focusing on two clusters of international tourism accommodation: the Pantai Mandiri area and Tanjung Setia. Informants were selected purposively (purposive sampling) and comprised:

1. Managers and owners of representative tourism-accommodation enterprises – Mrs. Marlin (owner and manager of Villa Nalu Krui) and the operational management team of Surfmatra Krui;
2. Operators of independent cargo-shipping and courier fleets that service the Bandar Lampung – Krui corridor;
3. Field-survey team representatives from the Research & Development Division of PT CHAIN ASIA CONNECT, who supervised the feasibility-study implementation.

3.4 Data-Collection Methods

Primary data were gathered through three techniques:

a. In-depth semi-structured interviews lasting 60–90 minutes per session, covering topics such as purchase frequency, price fluctuations, incidence of goods damage, history of supplier default (wanprestasi), and dispute-resolution mechanisms;

b. Participatory observation of the villa's storage facilities, monitoring of fresh-food storage temperature, and inspection of transportation routes traversing the TNBBS forest area;

c. Documentary collection of shipping invoices, purchase receipts, and cargo manifests for over-land routes across western Sumatra.

3.5 Data-Analysis Method

Data analysis was conducted interactively and cyclically, adopting the Miles, Huberman, & Saldana (2020) model. The process involved:

1. Data reduction of field material;
2. Data display by arranging the reduced data into a comparative matrix that juxtaposes cost burdens and legal-risk exposures;
3. Conclusion drawing and triangulation verification to ensure the credibility of the findings.

—

3. Results and Discussion

3.1 Logistic "Last-Mile" Obstacles and Ecological Vulnerability Across the TNBBS

The field investigation confirms that Krui's geographic isolation is the chief factor undermining the operational efficiency of tourism lodging. The only terrestrial access route linking the logistics hub of Bandar Lampung to Krui … (the manuscript segment ends here).

1. Introduction

The West Sumatra Highway traverses the spine of the Bukit Barisan Selatan National Park (TNBBS). This 240-km corridor is characterized by steep, narrow, poorly illuminated mountain-road contours and is highly vulnerable to landslides and falling trees, especially during the rainy season from October to April.

Under normal conditions, the travel time for freight vehicles ranges from 6 to 8 hours. However, when a landslide occurs on the TNBBS cliffs, the transit time can expand dramatically to 18–36 hours. Interviews conducted at Villa Nalu and Surfmatra revealed that 100 % of the general-purpose logistics fleet serving Krui consists of open-bed, non-refrigerated vehicles (dry freight trucks/pick-ups). The tropical ambient temperature (30 °C – 34 °C) and high humidity encountered during the mountainous crossing expose perishable commodities—such as chilled beef, mozzarella/cheddar cheese, dairy cream, lettuce, and cherry tomatoes—to severe degradation before they reach the villa kitchens.

1.1 Empirical Background

> **Table 1. Disparity Matrix of Prices, Transit Durations, and Spoilage Rates for Hospitality Raw Materials in Krui Compared with Bandar Lampung (Field Survey 2026)**

Commodity Category	Raw-Material Type	Average Wholesale Price in Bandar Lampung (Rp / kg)	Arrival Price in Krui (Rp / kg)	Price Disparity (%)	Spoilage Rate (%)	Existing Transport Mode
Beef	Sirloin / Tenderloin (chilled)	135,000	195,000	**+44.4 %**	18.5 %	Styrofoam box + liquid ice (non-refrigerated)
Dairy Products (Cheese & Butter)	–	110,000	150,000	**+36.3 %**	14.0 %	Passenger travel-van / cargo con-

						sign-ment
Fresh Leafy Vegetables (Salad-grade)	–	22,000	32,000	**+45.4 %**	22.5 %	Open-bed vegetable truck without cooling
Imported Fruits (Apple, Berry, Orange)	–	45,000	62,000	**+37.7 %**	12.0 %	Regular land cargo
Dry Staples (Rice & Oil)	–	14,500	17,500	**+20.6 %**	2.5 %	Grocery-expedition truck

Source: Primary data processed from in-depth interviews and R&D survey conducted by PT CHAIN ASIA CONNECT (2026).

As displayed in Table 1, the price disparity for fresh raw materials in Krui ranges from 36.3 % to 45.4 % higher than the parent market prices in the provincial capital. This disparity is not solely attributable to the profit margin of intermediary traders; it also reflects the transport-risk premium and compensation for the high rate of product deterioration, which can reach 18.5 % for certain items.

5. Findings and Proposed Collaborative Distribution Model

5.1 Operational Profitability Constraints

The analysis revealed that the cost of fresh meat accounts for 27.5 % of total food-and-beverage (F&B) expenditures, while fresh vegetables represent 22.5 %. This cost structure significantly compresses the operating profit margin of villas and resorts in Krui. Consequently, operators are forced either to impose high food-service tariffs on tourists or to absorb rapidly expanding operating expenses.

5.2 Juridical Vulnerability of Spot Transactions and the Absence of Contractual Legal Protection

The study found that all procurement transactions for hospitality raw materials in Krui are conducted as informal spot transactions via mobile-phone calls or WhatsApp instant messages, without any written formal commercial contract.

- Legal Basis of Oral Agreements: According to Article 1320 of the Indonesian Civil Code (KUHPerdata), an oral agreement is legally valid for parties who conclude it in accordance with the principle of **consensualism** and the doctrine of **pacta sunt servanda** (see Article 1338(1) KUHPerdata).
- Evidentiary Weakness: However, under the rules of evidence (Article 1866 KUHPerdata), oral agreements suffer from a critical evidentiary weakness when one party commits a breach (wanprestasi).

5.2.1 Empirical Illustration from In-Depth Interview

In a semi-structured interview with Mrs. Marlin of Villa Nalu, several recurring business disputes were disclosed, each lacking a clear legal remedy:

Type of Dispute	Description	Legal Gap
Quality-Related Wanprestasi	Out-of-town suppliers frequently deliver meat or vegetables that are near expiration (afkir). The absence of a **written Service Level Agreement (SLA)** specifying temperature-tolerance limits prevents villa managers from claiming damages or returning the goods.	No enforceable SLA; oral agreement cannot be proved.
Force-Majeure (Klausul Kahar) Omission	When the **TNBBS access road collapses due to a landslide**, trucks are stranded for days. The loss of cargo is **unilaterally charged to the buyer** under the pretext of a natural disaster beyond the carrier's control. Under standard commercial practice, the risk of loss **should remain with the seller/carrier** unless expressly transferred by contract.	No force-majeure clause allocating risk.
Unilateral Price Gouging	During the **World Surf League (WSL) championship season**, when villa occupancy reaches **100 %**, suppliers unilaterally raise raw-material prices by up to **50 %** above the original price, threatening to suspend supply.	No price-adjustment mechanism or ceiling in contract.

5.3 Reconstruction of a Collaborative Distribution Model and Pre-Feasibility R&D Framework for PT CHAIN ASIA CONNECT

To mitigate the dual distortion—(i) physical logistics failures and (ii) civil-law uncertainty—in the 3T (Terpencil, Terpencil, Terpencil) region of Krui, this research proposes a reconstructed collaborative distribution model anchored in the following components:

1. Formalized Contractual Architecture

- Draft standardized written contracts incorporating:
- Service Level Agreements (SLAs) with explicit temperature-control thresholds and monitoring protocols.
- Force-Majeure clauses that allocate risk of loss to the seller/carrier unless a higher-order event is proven.
- Price-Adjustment mechanisms (e.g., indexation, caps, and notice periods) to prevent unilateral gouging.

1. Digital Transaction Platform

- Deploy a mobile-first procurement application that records all order details, timestamps, and electronic signatures, thereby satisfying evidentiary requirements under Article 1866 KUHPerdata.

1. Joint Inventory and Cold-Chain Management

- Establish a shared cold-storage hub operated jointly by villa owners and certified suppliers, equipped with IoT temperature sensors linked to the digital platform for real-time compliance monitoring.

1. Risk-Sharing Insurance Scheme

- Introduce a micro-insurance product covering cargo loss during transit, funded jointly by suppliers and buyers, with premiums calibrated to the risk profile of each route.

1. Governance and Dispute-Resolution Body

- Form a local arbitration panel comprising representatives from the hospitality sector, supplier associations, and legal experts to adjudicate disputes swiftly, reducing reliance on formal courts.

5.3.1 Pre-Feasibility R&D Framework

Phase	Objective	Key Activities	Expected Output
Phase I – Diagnostic Study	Map existing supply-chain flows and legal bottlenecks.	Field surveys, stakeholder interviews, legal audit.	Baseline report and gap analysis.
Phase II – Prototype Development	Build the digital procurement prototype and SLA templates.	Software development, pilot drafting of contracts, sensor installation.	Functional prototype and pilot contracts.
Phase III – Pilot Implementation	Test the collaborative model in a subset of villas (n = 5).	Training, live transactions, data collection on temperature compliance and price stability.	Performance metrics (e.g., reduction in price volatility, compliance rate ≥ 95 %).
Phase IV – Evaluation & Scaling	Assess pilot outcomes and refine the model for broader rollout.	Statistical analysis, stakeholder feedback, cost-benefit analysis.	Finalized model ready for regional scaling.

By institutionalizing formal contracts, digital traceability, and shared risk mechanisms, the proposed model aims to stabilize input costs, protect operational margins, and enhance legal certainty for hospitality enterprises operating in Krui's remote coastal environment.

1. Integrated Collaborative Distribution Model

The conceptual framework is constructed on the synthesis of supply-chain collaboration theory (Simatupang & Sridharan, 2022) and the doctrine of contractual fairness in modern civil law (Gunawan & Siregar, 2022).

In this context, PT CHAIN ASIA CONNECT, through its Research & Development (R&D) Division, is conducting a preliminary feasibility study to validate the supply-chain intervention architecture in West Coast Regency. The intervention model rests on three mutually reinforcing strategic pillars:

A. Aggregated Demand Pooling – Villa and homestay operators in Krui are consolidated onto a single integrated digital collective-booking platform to achieve economies of scale, thereby enabling direct price negotiations with primary distributors at the producer level without the intermediation of multi-tiered middlemen.

B. Scheduled Cold-Chain Transit & Micro-Hub – Operation of medium-capacity refrigerated trucks (2–3 ton) on a regular schedule of two to three trips per week from Bandar Lampung, traversing the South Bukit Barisan National Park (TNBBS) corridor to Krui, supported by a micro-cold-storage hub equipped with dual-temperature zones (chiller at 0 °C – 4 °C and freezer at −18 °C) to serve as buffer stock for critical commodities.

C. Fair Commercial Supply-Contract Standardization – Drafting a standardized written supply agreement that incorporates Service-Level-Agreement (SLA)-based quality specifications, a fair risk-sharing mechanism underpinned by integrated cargo insurance, and a price-ceiling clause for a 3- to 6-month period to mitigate speculative inflation during the World Surfing Championship season.

2. Conclusions and Recommendations

Geographic isolation of West Coast Regency behind the South Bukit Barisan National Park (TNBBS) corridor has been shown to generate structural constraints that disadvantage the marine-tourism sector in Krui. The absence of a refrigerated (cold-chain) transport mode creates price distortions for fresh raw materials, with costs up to 45 % higher than those in the provincial capital, and physical product damage rates ranging from 18 % to 22 %. Simultaneously, the reliance of hospitality operators (e.g., Villa Nalu and Surfmatra) on oral agreements lacking formal SLA-based contracts places them in a vulnerable position of default risk and unilateral exposure to hazards when natural disasters such as landslides sever transport access.

Reconstruction of an Integrated Collaborative Distribution Model

The reconstruction of an integrated collaborative distribution model—one that integrates the consolidation of aggregate

digital demand, scheduled refrigerated transportation with micro-cold-storage hub facilities, and the standardization of equitable commercial supply agreements—provides a solution that is both actionable and measurable for the sustainable economic development of tourism in the 3T (remote, under-developed, and disadvantaged) regions.

This model is currently undergoing a preliminary feasibility study conducted by the R&D Division of PT CHAIN ASIA CONECT in order to map the technical, economic, and juridical parameters prior to full-scale implementation.

For subsequent researchers, it is recommended to obtain a broader data coverage when testing the elasticity of willingness to pay among local hotel operators for premiums that guarantee the certainty of integrated logistics supply.
